NOTES

Water Wise

All of the above species are considered 'water-wise' once established in their new surrounds. However must allow for watering for the initial 3-5 years post planting

Invasive Root system

ANY plant species would have the capacity to cause issues of disturbance to their surrounds. Obviously the species with larger surface orientated roots such as Tipuana, Liquidambar, Ficus (some of) tend to develop larger roots than most so they can cause the most issue. However implementing measures at the time of planting can help mitigate/manage the potential for such issues to arise

Allergies

London Plane seeds are said to be an allergen by some sources, not an allergen by others. Hayfever sufferers may be impacted by Bottlebrush, Melaleuca flowers

Questions

How strongly do you agree with the following statements?
1= strongly disagree 5= strongly agree

1. Increasing the number of street trees is one of the Town's top priorities
2. The Town is doing enough to protect all its street trees from removal or damage
3. I think the best part of the Town's streetscapes are the high quality of trees/investment
4. I believe there are not enough Australian native trees in the Town
5. I am concerned that if the Town was to only have a few species of trees, it would limit diversity for fauna and increase risk
6. I am not concerned with the species of trees, so long as they suit the conditions and look good to compliment the area
7. I think there should be a balance between native and exotic species that work for the area
8. I like the look of streets elsewhere in the world, and think Australia could do it much better
9. Trees should provide as much shade as possible during our harsh summer, and allow warmth in winter
10. What makes an attractive street is neat consistent rows of well maintained, attractive trees, creating a boulevard
11. I would like to see a greater rate investment on street trees

- = Overall importance
- = current approach to removal and action on vandals
- = current perception of street tree quality
- = understanding of current tree stock split / preference
- = scope for limited or many species [range]
- = preference for native / exotic, importance of look vs environment [practical elements]
- = understanding of current tree stock split / preference
- = More of the same? Examples from Australia or model from elsewhere [will lead into vision / concept well]
- = preference for deciduous trees
- = preference for boulevards / one species and rows

looks are equally as important as suitability - see hiquality result	Balance approach needed - see ratio below	benchmark the world, not australia!	include large proportion of deciduous options - see aus natives results	more boulevards in STMP - see alos diversity result	increase \$ spend - see also hi quality result
